INTRODUCTION

This is the thirty-fourth edition of Florida Morbidity Statistics and continues the series begun in 1945. Data on the reported incidence of notifiable diseases are presented. Some unpublished records for the years 1918 through 1944 are available upon request from the Epidemiology Section.

SOURCES OF DATA

Figures in this report are based on case reports furnished to county health units by private physicians, hospitals, clinics, or others. These reports, in turn, are forwarded by the county health units to the Health Program Office.

Other sources of data include death certificates and laboratory reports which are routinely checked for previously-unreported cases of the notifiable diseases.

The population figures used in calculating the case rates for certain diseases are estimated by the Bureau of Economic and Business Research, College of Business Administration, University of Florida.

DIAGNOSIS

For most diseases included in this report, a diagnosis by the reporting physician has been the criterion for acceptance. For some diseases, such as amebiasis, anthrax, arthropod-borne encephalitis, brucellosis, diphtheria, leptospirosis, malaria, poliomyelitis, psittacosis, salmonellosis (including typhoid), shigellosis, syphilis, tuberculosis, tularemia, and typhus, confirmation by laboratory examination is usually available.

MONTHLY DATA

The tabulation of cases by month (Table No. 1) is based on month of receipt of the report rather than on the month of onset of the disease. In many instances, the date of onset is not reported; in cases of chronic illness, this date cannot be determined with accuracy. For infectious illnesses with short incubation periods, the reported month describes the seasonal pattern of attack with a fair degree of accuracy.

RESIDENCE

Data for this report are normally tabulated by usual residence of the case which generally coincides with the place where the diseases were contracted. This procedure is followed because many cases

are hospitalized in other counties and, therefore, reports often originate at the place of treatment rather than the place of the infection.

COMPLETENESS OF REPORTING

It is well known that many notifiable diseases are incompletely reported; however, the degree of underreporting is undetermined. An ad hoc committee has recently revised DHRS Rules and Regulations pertaining to communicable diseases in an effort to improve the completeness and accuracy of communicable disease reports.

EPIDEMIOLOGIC NOTES:

Leptospirosis. Between June 5 and August 19, 1978, an outbreak of 19 leptospirosis cases in humans occurred on three dairy farms in Lafayette County. Eighty-three workers and residents were interviewed; 19 were identified as having leptospirosis as defined by clinical symptoms and serologic testing by microscopic agglutination techniques.

For all farms combined persons involved with milking had a 42% attack rate; non-milkers had a 2% attack rate ($p \leq .00001$ Fisher's 1-tailed test). Frequency of milking was directly related to development of disease, suggesting a dose-response relationship. The infecting serogroup for the 13 patients on Farm A was Hebdomadis. A serosurvey of dairy herds showed Hebdomadis to be the predominant serogroup affecting cows on Farm A, and a bovine urine culture isolate from Farm A was identified as serogroup Hebdomadis serovar balcanica by Bureau of Laboratories, CDC (Leptospire serovar not previously isolated in the United States). Hebdomadis was the predominant serogroup also on Farm C, with Pomona on Farm B.

The consistency of laboratory data for bovine and human-infecting serogroups supports the strong epidemiologic association of disease with milking, further implicating cows as the source of infection and leptospirosis as an occupational hazard of dairy farming.

Eastern Equine Encephalitis. Five human cases of Eastern Equine Encephalitis (EEE) were reported in 1978, occurring from June through September. There were three deaths. The cases were widely dispersed throughout Florida in the following counties: Alachua, Collier, Dade, Pasco, and Volusia. No human cases of St. Louis Encephalitis (SLE) were reported.

Measles (Rubeola) and Rubella. Florida experienced a significant increase in reported cases of measles in 1978. Measles occurred throughout the state with laboratory confirmation coming from 28 counties. A four-fold increase in reported cases (1203 in 1978 as compared to 308 in 1977) has led to stepped-up activities to control this disease. Along with the increased number of cases, there was an upward shift in the ages of persons affected, with the highest attack rates occurring in persons 10-19 years of age (Table A).

Similarly, rubella outbreaks were reported among high school and college-age students in 1978 and individual case reports showed that persons 15 years of age and older accounted for more than one-half of the total cases. In order to determine the susceptibility of persons in the older age groups (15-24 years) to measles and rubella a sampling of sera submitted to public health laboratories for premarital testing and sera from students from three Florida universities were tested for rubella and measles hemagglutination inhibition (HI) antibody titers. Of the total population of 15-24 years (N = 333) tested, antibody levels were not protective for rubella (titer $<$ 1:8) in 17% and for measles (titer $<$ 1:5) in 9%. Twenty-nine percent of the 15 and

16 year-olds tested did not have protective antibodies to measles.

The findings of this serologic study and the increasing attack rates in older age groups prompted increased immunization efforts by the Department. Special school immunization programs directed against measles and rubella for junior and senior high school students were held in seven counties in 1978. The number of doses of measles and MMR vaccine administered by county health units is shown in Table B.

TABLE A

Reported Measles Cases
By Age Group and Attack Rates
Per 100,000 Population, Florida, 1978

Age	Total	<1	1-4	5-9	10-14	15-19	20-29	30+	Unk
Population	8,959,000	114,000	441,000	620,000	658,000	755,000	1,440,000	4,931,000	-
Cases Reported	1203	34	138	164	477	267	45	21	57
(Percent)	(100.0)	(2.6)	(11.5)	(13.6)	(39.7)	(22.2)	(3.7)	(1.8)	(4.7)
Attack Rates	13.4	29.8	31.3	26.5	72.5	35.4	3.1	0.4	

TABLE B

Total Doses of Measles
and MMR (Measles-Mumps-Rubella) Vaccine
By Age Groups, Administered By County Health Units,
Florida, 1978

Age	All Ages	<1	1-4	5	6+
Measles	5,256	7	379	193	4,677
MMR	78,519	332	54,843	6,770	16,574
TOTAL	83,775	339	55,222	6,963	21,251

Acknowledgments: The Epidemiology Section of Disease Control hereby acknowledges contributions during 1978 of E. Charlton Prather, M.D.,M.P.H.,M.S., Staff Director, Health Program Office and State Health Officer; and of Juan A. Tomas, D.V.M.,M.P.H., State Public Health Veterinarian.

Acknowledgment is made also for the important role played by Laboratory Services, the Central Laboratory, branch laboratories, the Epidemiology Research Center, Vital Statistics and Public Health Statistics, and the Office of Management Systems Computer Services.

Further acknowledgment is made to HRS Districts and county health units for their collective efforts in the statewide morbidity surveillance and reporting system. The individual participation of physicians, hospitals, nurses, sanitarians, infection control nurses, and clerical staff is likewise greatly appreciated.

In addition, the role of the immunization, venereal disease, and tuberculosis control programs in the overall communicable disease effort is gratefully acknowledged.
